

Kim Kiranyaz, 8

“My dad builds steel walls that turn sunshine into electricity.”

Kim's father develops facade elements with integrated solar cells.

Innovation leaders.

Frank Kiranyaz and his colleagues came up with a brilliant idea – to combine conventional steel building elements with a flexible, lightweight solar cell package. The result is a facade which both generates and conserves energy while at the same time offering protection against wind and weather.

In future markets like this we devote all our energies to developing innovative solutions. And that's another reason why ThyssenKrupp is such an attractive investment.

Developing the future.
